2. Dashboard for tracking loans

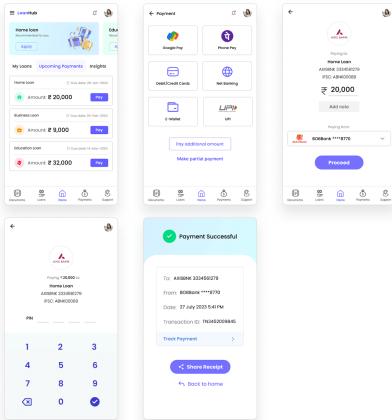

Below UX suggestion can be used to provide simplified experience and give app a unique trait from competitors
Using Machine learning for Personalized Smart Loan Recommendations:

- Utilize machine learning algorithms to analyze user behavior, historical data, and market trends to offer highly personalized loan recommendations. The system can learn from user preferences and adapt to provide more accurate suggestions over time. In below screen top most widgets of offers can be used.

3. Making EMI Payment

Below UX suggestion can be used to provide simplified experience and give app a unique trait from competitors
Allow users to make partial payments of pay additional amount also explain then what impact this will have on entire loan process/tenure

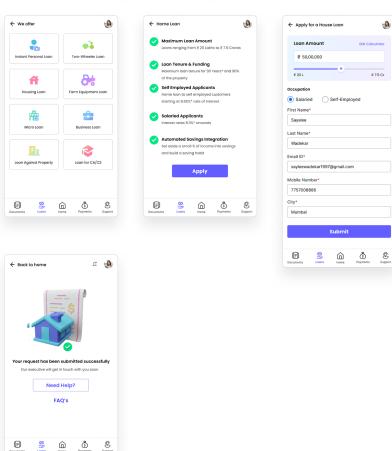

4. Applying for loan

Below UX suggestion can be used to provide simplified experience and give app a unique trait from competitors
Robotic Process Automation (RPA) for Streamlined Processes:

- Use RPA to automate repetitive tasks within the app, such as data entry, validation, or document processing. This reduces manual efforts and enhances the efficiency of backend processes.

Automated Savings Integration:

- Set aside a small percentage of income into savings automatically

5. Smart Document Scan: Helps in auto-filling the loan application forms

Below UX suggestion can be used to provide simplified experience and give app a unique trait from competitors
Image Recognition for Document Handling:

- Implement image recognition to simplify document handling. Users can take pictures of loan-related documents, and the AI can extract and organize relevant information automatically, reducing manual data entry.
